Student Model

Software Requirements / Logical Data Model

1. Purpose

Represents a student who may apply for hostel accommodation and use student-facing hostel services.

2. Responsibilities

• Maintain the student’s identity and contact/profile information needed by hostel administration.

• Associate a student with their account, applications, allotments, renewal requests, complaints and fee records where applicable.

• Allow permitted profile details to be updated while protecting administrative or verified fields.

3. Proposed Logical Attributes

The following is a documentation proposal, not a claim that every field is already implemented. Confirm exact field names, types, constraints and cardinalities against the project ERD/database schema.

Attribute	Meaning / Requirement
student_id	Unique identifier for the student record; primary key or stable system identifier.
account_id	Reference to the associated user account, if accounts and student profiles are separate.
full_name	Student’s recorded name.
registration_or_roll_number	University identifier used to verify the student.
department_or_program	Academic affiliation, if collected by the university.
contact_details	Permitted phone/email or other contact information.
status	Student record state, if required, such as active or inactive.

4. Relationships

• One student may submit multiple hostel applications over time, subject to policy.

• A student may have one or more historical allotment, renewal, complaint and payment records.

• A student may be associated with visitor records when the visitor module records visits to a resident.

5. Validation and Business Rules

• Use a stable unique identifier for each student record.

• Validate required identity fields and prevent duplicate university identifiers where policy requires uniqueness.

• Restrict access to personal information according to user role.

• Record changes to sensitive or administrative fields where audit logging is required.

6. Traceability / Notes

The exact attributes and cardinalities must be checked against the project ERD and database design before implementation.

Status: Draft for review. Align this document with the approved SRS, ERD, class diagram, and institutional policies before treating it as final.
