Hostel Application Model

Software Requirements / Logical Data Model

1. Purpose

Represents a student’s request for hostel accommodation.

2. Responsibilities

• Capture a student’s application and submission details.

• Track the application’s review state.

• Provide a record for administrators to verify, approve or reject.

3. Proposed Logical Attributes

The following is a documentation proposal, not a claim that every field is already implemented. Confirm exact field names, types, constraints and cardinalities against the project ERD/database schema.

Attribute	Meaning / Requirement
application_id	Unique application identifier.
student_id	Reference to the applicant student.
submitted_at	Date/time the application was submitted, if recorded.
status	Workflow state, such as submitted, under review, approved or rejected, as defined by policy.
reviewed_by	Staff/account reference for the reviewer, if recorded.
reviewed_at	Date/time of review, if recorded.
decision_reason	Optional reason or notes for rejection/decision.

4. Relationships

• Each application belongs to a student.

• An application may be reviewed by an authorized administrator.

• An approved application may lead to an allotment, subject to availability and policy.

5. Validation and Business Rules

• Students should be able to view their own application status.

• Only authorized staff should make administrative decisions.

• The system should prevent invalid state transitions and preserve decision history where required.

• Application approval must not itself create duplicate bed occupancy.

6. Traceability / Notes

The allowed states and whether supporting documents are required must be confirmed from project policy.

Status: Draft for review. Align this document with the approved SRS, ERD, class diagram, and institutional policies before treating it as final.
