Student Profile Service

Document type: Proposed service specification

Purpose

Maintains student profile data used by application, allotment and fee workflows.

Main responsibilities

• Create/retrieve profiles

• validate required fields

• update permitted details

• limit fields returned by permissions.

Typical inputs

Student identifier and schema-defined profile fields.

Typical outputs

Student profile/update or validation/not-found/authorization error.

Proposed business and validation rules

• Match uniqueness and field constraints to schema

• protect personal information

• do not invent unapproved fields.

Important implementation note

This PDF is a proposed draft based on the service name and common hostel-management workflows. The original Markdown file contains only a short heading/name, so the responsibilities, inputs, outputs and rules are not verified against implemented code. Before treating this as final SRS documentation, reconcile it with approved requirements, ERD/database schema, project policies and actual service implementation.
