Allotment Model

Software Requirements / Logical Data Model

1. Purpose

Represents the assignment of a bed/accommodation slot to a student.

2. Responsibilities

• Record which student is assigned to which bed and under what period or decision.

• Support current occupancy and historical allocation records.

• Provide traceability for allocation changes.

3. Proposed Logical Attributes

The following is a documentation proposal, not a claim that every field is already implemented. Confirm exact field names, types, constraints and cardinalities against the project ERD/database schema.

Attribute	Meaning / Requirement
allotment_id	Unique allotment identifier.
student_id	Reference to the student receiving accommodation.
bed_id	Reference to the assigned bed; may be derived through room depending on schema.
application_id	Optional reference to the application that led to the allotment.
start_date	Start date of the allotment, if tracked.
end_date	End date or checkout date, if tracked.
status	Active, ended or other defined state.

4. Relationships

• An allotment links a student to a bed/accommodation slot.

• An allotment may originate from an approved application or renewal/transfer process.

• Allotment records may be used by fee, renewal and reporting services.

5. Validation and Business Rules

• A bed must not have more than one conflicting active allotment.

• The student and bed references must exist before an allotment is saved.

• Date ranges must be valid where start/end dates are maintained.

• Allocation changes should be auditable.

6. Traceability / Notes

The project objective explicitly calls for preventing duplicate bed allotments. Confirm exact dates/status fields against the ERD.

Status: Draft for review. Align this document with the approved SRS, ERD, class diagram, and institutional policies before treating it as final.
