Authentication Service

Document type: Proposed service specification

Purpose

Verifies a user identity during sign-in and supports logout/session termination.

Main responsibilities

• Validate credentials

• establish session/token after success

• return safe failure messages

• end sessions on logout.

Typical inputs

Login identifier, credential and session context.

Typical outputs

Authenticated session/result or authentication failure.

Proposed business and validation rules

• Never store/log plain-text credentials

• authorization is separate

• follow approved password and session policies.

Important implementation note

This PDF is a proposed draft based on the service name and common hostel-management workflows. The original Markdown file contains only a short heading/name, so the responsibilities, inputs, outputs and rules are not verified against implemented code. Before treating this as final SRS documentation, reconcile it with approved requirements, ERD/database schema, project policies and actual service implementation.
