# Application Tracking Service

**Document type:** Proposed service specification

## Purpose

Provides permitted users with application progress and status information.

## Main responsibilities

• Find application

• return current status and milestones

• limit details to authorized viewers.

## Typical inputs

Application ID/search criteria and requester permissions.

## Typical outputs

Tracking details or not-found/authorization error.

## Proposed business and validation rules

• Applicants should normally see only their own applications

• staff access follows roles

• avoid unnecessary personal data.

## Important implementation note

This PDF is a proposed draft based on the service name and common hostel-management workflows. The original Markdown file contains only a short heading/name, so the responsibilities, inputs, outputs and rules are not verified against implemented code. Before treating this as final SRS documentation, reconcile it with approved requirements, ERD/database schema, project policies and actual service implementation.
