Room and Bed Management Service

Document type: Proposed service specification

Purpose

Maintains room/bed inventory and supplies availability to other workflows.

Main responsibilities

• Create/update room and bed records

• validate relationships

• retrieve availability

• prevent invalid changes to active assignments.

Typical inputs

Hostel/room/bed references and schema-defined inventory fields.

Typical outputs

Inventory/availability information or validation/conflict error.

Proposed business and validation rules

• Match ERD relationships

• derive availability consistently from allotments

• handle occupied rooms/beds safely.

Important implementation note

This PDF is a proposed draft based on the service name and common hostel-management workflows. The original Markdown file contains only a short heading/name, so the responsibilities, inputs, outputs and rules are not verified against implemented code. Before treating this as final SRS documentation, reconcile it with approved requirements, ERD/database schema, project policies and actual service implementation.
